Earlier this week, news broke that Samsung would offer South Korean customers who purchased a Note7 an exchange option that includes the ability to swap their Notes for a choice of another Samsung device, at a discount. That's nothing new; similar options are available in United States and other countries. What's different about the South Korean offer is the fact that in addition to being able to swap phones for a Galaxy S7 or GS7 edge, Note7 owners in that country can reportedly also opt for a discounted "Note 8" smartphone, when it becomes available, according to Reuters.com. From Reuters: "In a statement on Monday, Samsung said customers who trade in their Note 7 phone for either a flat-screen or curved-screen version of the Galaxy S7 can trade up for a Galaxy S8 or Note 8 smartphone launching next year through an upgrade program." A good amount of speculation has made its way around the web following the many turning points on Samsung's ill-fated Note7 timeline regarding the possibility of the company killing

off it popular "phablet" brand, or at least rebranding the Note. Samsung's statement to Reuters appears to fly in the face of those rumors, but a company spokesperson gave me some less convincing information: "As for the reports on the exchange program in Korea, that offering refers to the availability of S8 in that market and is regionally specific. Samsung has not officially communicated any information about a new Note lineup, so any reports referring to a new Note device are purely speculation and are not in reference to any communications from Samsung will indeed release a new Note phone. "I don't see them dropping the Note brand," says Patrick Moorhead, president and principal analyst with Moor Insights & Strategy. "I think come January or March — January at CES or March and principal analyst with Moor Insights & Strategy." a different industrial type of coating on it. But it will be their high-end phone that not only goes after high-end consumers but enterprise as well." Samsung's made a lot of phones, for quite some time, years and years," says Tuong Nguyen, a principle research analyst with Gartner. "This seems like a bit of a blip on the radar. [Related: CIOs discuss whether Note family, the line that literally created the whole modern phablet craze. Both Samsung's overarching image and its Note brand are taking a very real hit due to the recall, but the Note7 was the sixth iteration of a very successful and innovative mobile device. Shuttering or rebranding the Note product line could reverse much of the ground Samsung has gained in consumer hearts and minds. For years, the narrative in the mobile world was, "Samsung copies the iPhone!" The Note flipped that story around, and with the iPhone 6 Plus, Apple started copying Samsung. Samsung needs to atone for the bungled release of the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the whole situation. But killing the Note 1 in subsequent mishandling of the Note 2 in subsequent mishandling of the Note 2 in subsequent mishandling of the Note 3 in subsequent mishandling mishandli course, does not spontaneously combust. AS Thinkstock Click image to enlarge and see source links. While one very specific version of the Galaxy Note 10+ runs the newest iteration of the world's most popular mobile OS out the box, all other members of Samsung's latest S Pen-wielding handset family obviously came preloaded with Android 9.0 Pie a few months ago. But surprise, surprise, surprise, surprise, the official rollout is reportedly already underway, at least in Germany for both Note 10 and Note 10+ users who participated in the company's public beta program. Everyone else needs to wait before getting a piece of the action, although if recent Galaxy S10, S10+, and S10e updates are any indication, an expansion to non-beta testers across various European and Asian territories should happen fairly quickly. By the way, the S10 lineup was initially scheduled for a January 2020 jump to Android 10 as well, so all things considered, today's deployment is not all that shocking. Especially after Samsung also kicked off its first stable Android 10 rollout for a mid-range duo in India just the other day. We'll be honest with you, we have absolutely no concrete, official information on Android 10 US release timelines for any Samsung phones. But we can certainly make a few educated quesses based on how fast things have been progressing internationally. For starters, you obviously shouldn't expect the Note 10 lineup to beat the Galaxy S10 family to the punch anywhere around the world. That's just how these things go, and it really doesn't matter that the Note 10+ is newer or pricier than the Galaxy S10+. Secondly, you'll want to keep in mind that Samsung needs to work together with US carriers to "optimize" this fresh batch of software tweaks and performance enhancements for every individual S10 and Note 10 variant. Of course, there are also unlocked models sold stateside that don't require any involvement from wireless service providers in this optimization process, but for reasons we have never been able to comprehend, these unlocked versions of Samsung flagships often take longer to score major OS promotions. The answer to that question differs significantly from device manufacturer to manuf interface for Android handsets goes a little lighter on the modifications, focusing on "everyday simplicity." That doesn't mean your Android 10 changelog will be short, including everything from new full screen gestures (borrowed from Google) to a few small but important one-handed mode improvements, as well as various security enhancements (biometrics included), expanded digital wellbeing tools, a more detailed battery usage graph, and a whole bunch of revised built-in apps and tools like Samsung Internet, Contacts, Calendar, Reminder, and Calculator. In terms of the overall look and feel of your OS, there aren't a lot of radical changes in the pipeline, but you should nevertheless expect the update to tip the scales at well over 1GB with loads of under-the-hood improvements in tow that you'll undoubtedly learn to appreciate with time. Ever since I first discovered Samsung's Galaxy Note line, I've been a fan. Yes, the phone is large, and no, the S-Pen stylus isn't something that everyone loves. But having the ability to take notes on my phone without typing can be game-changing for a writer. And that big screen has always made this an underrated on-the-go multimedia powerhouse. And all of that stuff gets even better with the latest Samsung Note, the Note 10 Plus, an Android phone that just may be the best all-around companion device I've ever had, in large part because of its versatility. There are loads of productivity goodies here to get me through the work day, but enough fun and multimedia goodness to let me relax and binge plenty of Netflix. Add in stellar battery life (something few phones can really claim these days), an ultra-zippy processor, and arguably the most polished display of any phone on the market, and there are times when I can barely put my Note 10 Plus down. It's not quite a flawless Android phone, but it's certainly super-close, so if you can afford the price tag (\$1,099 off-contract), this is the way to go. samsung Note 10+samsung too!) Screen recorder app is terrificConsNo headphone jackButtons feel out-of-placeStill no voiceover features with editing softwareThe Note 10 Plus. The Aura Glow color of the Note 10 Plus back is instantly eye-catching, the kind of phone that you don't want to cover up in a case. How eye-catching? I've gotten comments and queries about my Note 10 on the train. The front of the most potent colors you'll find. Blacks look super-deep, and all colors pop, and the Note 10's overall screen brightness is potent enough to hold its own in the sunlight, even if you want to watch movies. Movie-viewing, quite naturally, is what this screen begs for you to do, and binging Netflix or checking on the Red Zone Channel on Sling TV are both magical experiences. Not all apps use the screen the same (Netflix takes advantage of the full panel, while Sling uses a slightly smaller form factor). But whatever you watch, expect to enjoy it. If there's a downfall to all this beauty, it's the fingerprints that my Note 10 consistently accrues. Hold the thing for five minutes, and I've collected a police crime lab full of them. The issue isn't as noticeable on the screen, because the Note's brightness trumps such issues, but on that Aura Glow black, they're constantly collecting. Samsung Battery Life and Snappiness to the MaxThat exterior is only the start. The Samsung Note 10 Plus continues to impress the more you use it, and one of the most noticeable reasons is because you can use it heavily without the need to constantly recharge. Much like Google's Pixel, the Note 10 Plus has a large battery. I use my phones pretty heavily, and I can easily cruise through a full workday without ever having to worry about charging my Note 10. When I use the Samsung Note 10 Plus, I'm consistently greeted to snappy performance as well. Apps, even complex ones, load almost instantly, and the entire experience is a joy. If you use your phone mainly for web browsing and social media, you'll find more than enough power here, and even more complex tasks, like video editing, work efficiently. The fingerprint and facial recognition processors are also better than they've ever been. In previous years, this was one of the main things separating Samsung from Apple—and the placement of the fingerprint scanner was also an ever-present issue. This year, Samsung has its security tech down; everything is fluid and easy to use. Software-wise, Samsung continues to cut down on bloatware on the Note 10 Plus, leaving you only with goodies you'll want. The more barebones package is refreshing, with just a single panel of apps, but the good ones, like Microsoft Office and Samsung's excellent and underrated Secure Folder, remain. Once I added Instagram, Facebook, and Twitter to the mix, I felt pretty set. Room for Improvement In Camera SoftwareSamsung's new camera, meanwhile, holds its own. It's still not quite up to the level Google's fine Pixel line, but it does deliver strong shots, and its low-light modes are improved. So too are the editing features on the Samsung Note 10 Plus, which are accessible and easy-to-use once again. As a content creator, what I really appreciate is the return of slow-motion editing. This had disappeared (or been otherwise buried and I never could find it again) on the Note 9, but it's now easy to access, which can once again make for fun fitness video. (Need some tips on using the camera? Check here.) The downer: There's still no voiceover option available for video editor program. But this is a win for Apple's iMovie, which continues to lead the space as a well-rounded video editing software for content creators. Like Google's Pixel, Samsung's camera does the job, but it's editing software needs that extra layer to be truly complete, at least for my purposes. The S-Pen Can Read My WritingSamsung's S-Pen saw major progress with floating controls last year, and these all return. So too does a potentially game-changing upgrade if you've always wanted to be a major note-taker on your "writing." Use it within Samsung Notes, and you can scrawl whatever you want, then, with the press of a button, Samsung will try to convert that into text that you can then import just about anywhere through a variety of means. Now, if your handwriting is abominable (as mine is), this won't always work flawlessly. The Note 10 tried to convert my note of "5 squats" into "MYARMS". But when I took my time a bit more, it did convert "test, 1-2-3, Thor" into . . . "Test, 1-2-3, THOR." Not bad. Don't count on writing full papers here, but this is ideal if you're taking notes in a meeting and want to email yourself later. And really, having the Note somewhat legibly convert my chicken-scratch into anything more readable was a serious plus. I generally type every workout I'm going to do before doing it, and it's not exactly hard to do that. But it was even better doing it with the S-Pen, and scrawling extra notes on the side of the page, just like I used to do when I wrote workouts in a classic notebook. The S-Pen, which is tucked into the righthand bottom corner of the phone rather snugly this year, performs the rest of its tasks ably, too, and all the note-taking conveniences of previous years return as well. If you buy the Samsung Note 10 Plus, hopefully you do so to take advantage of what Samsung has to offer here; you don't want to miss it. But the Buttons! Overall, Samsung's Note 10 Plus is a fantastic device and it's one of the Android family's crown jewels, with very few weaknesses -- but there are some things you may wish it had. Most of these are minor. You'll hear some people complain that, for the first time since it hit the market, the Note 10, has no headphone jack unless another techphile was mentioning it. We live in a world that's Bluetooth enough, especially for power users, that this won't be much of an issue. The more pressing issue (sort of pun intended) is the shifting of the power button to the left side of the phone. Samsung has a rationale for this, but it's such a shift away from the way other phones do business that it does take a little getting used to. Make no mistake: You can adjust to it, though, so don't let this be a dealbreaker. Especially because the rest of the phone is so good. The Samsung Note 10 Plus has very swiftly become a go-to Android device for me, a perfect way for me to quickly do some work on the go while still having plenty of fun, too. Ebenezer Samuel, C.S.C.S.
